AI-Powered Social Media, Marketing, and RAG Stack (Validated GitHub Repos, 2026)

Executive Overview

This report validates and refines a full-stack architecture for AI-driven social media content creation, autoposting, marketing automation, email campaigns, Telegram chatbots, orchestration, and local RAG with MCP, using current open-source projects and APIs as of April 2026.[1][2] [^3]
It focuses on production-grade components that are actively maintained, multi-platform capable, and well-documented, and it highlights discovery URLs where the most-starred AI projects can be tracked over time.[4][5] [^1]

Social Media Content Creation & Autoposting

Core Multi-Platform Schedulers (TikTok, Instagram, YouTube, Facebook, X, LinkedIn, etc.)

These are the most robust open-source or API-first tools for multi-platform scheduling and posting.

Tool	Type	Platforms (examples)	Why It Matters
Postiz (`gitroomhq/postiz-app`)	Self-hosted social media scheduler + AI	X/Twitter, Instagram, Facebook, TikTok, Reddit, LinkedIn, YouTube, Threads, Pinterest, Bluesky, Mastodon, Discord, Slack, Telegram and more (19+ channels)	Open-source alternative to Buffer/Hootsuite; supports cross-platform scheduling, analytics, AI-assisted content, team workflows; ships Docker and Helm deployment recipes.[6][7] [8][9] [^10]
Postiz n8n node (`gitroomhq/postiz-n8n`)	n8n community node	Same as Postiz	Lets n8n workflows schedule and publish via Postiz, ideal for AI-agent-driven posting pipelines.[11][1]

Tool	Type	Platforms (examples)	Why It Matters
Postiz CLI Agent (`gitroomhq/postiz-agent`)	CLI for AI agents	28+ channels including X, LinkedIn, Reddit, YouTube, TikTok, Instagram, Facebook, Google Business, Pinterest, Discord, Slack, Telegram, etc.	Designed so LLM agents or scripts can list integrations and programmatically create multi-platform posts and campaigns.[12][13][^14]
Ayrshare Social Media API (`ayrshare/social-media-api`)	Unified REST + SDK	Facebook, Instagram, LinkedIn, TikTok, X/Twitter, YouTube, Pinterest, Google Business, Reddit, Telegram, Bluesky, Snapchat, etc.	Commercial API with free tier; one endpoint for posting, analytics, comments, DMs, and auto-scheduling to 13+ networks.[15][16][17][18]
Ayrshare Social API Demo (`ayrshare/social-api-demo`)	React/Node demo app	Same as Ayrshare API	Reference implementation for composing, scheduling, and posting to multiple platforms from a single UI.[19][18]
Social Media Scheduler (`Masterjx9/socialmediascheduler`)	Desktop + mobile app	Instagram, X/Twitter, Facebook, TikTok, YouTube (WIP)	Open-source cross-platform scheduler built with React Native, demonstrating multi-platform posting from phone and desktop.[20][21][22][23]
Social Poster CLI (`profullstack/social-poster`)	Headless CLI autoposter	X/Twitter, TikTok, Pinterest, LinkedIn, Reddit, Facebook, others	CLI-first tool with AI-powered content generation and auto-detected selectors for web-based posting flows.[^24]

For turnkey, self-hosted scheduling across nearly all requested channels, Postiz plus its n8n node and CLI agent forms the strongest open-source foundation.[6][7][8][11][^10]
Ayrshare is ideal when you prefer a hosted, SLA-backed API for scheduling, analytics, and cross-platform posting from your own applications or workflows.[15][16][17][18]

AI Content Generation for Social Posts (Text, Images, Video)

Tool	Capability	Notes
Flowise (`FlowiseAI/Flowise`)	Visual LLM agent/workflow builder	Drag-and-drop editor to build GPT-style agents that generate captions, ideas, and carousels; can embed chat widgets in sites.[25][26][27][28][29][30]
LangChain (`langchain-ai/langchain`)	Agent & tool framework	Python/JS framework to build multi-step content agents (idea → outline → posts per platform) integrated with vector stores and tools.[31][32]
Dify (`langgenius/dify`)	Agentic workflow/RAG platform	No/low-code app builder for agents and chatbots; supports marketing and content-generation flows with observability and plugin ecosystem.[33][34][^35]
Stable Diffusion Web UI (`AUTOMATIC1111/stable-diffusion-webui`)	Image generation UI	De facto open-source UI for Stable Diffusion; widely used to generate thumbnails, ad creatives, and storyboards.[36][37][^38]
ElevenLabs Python SDK (`elevenlabs/elevenlabs-python`)	Voice synthesis	Official SDK for ElevenLabs; commonly used to generate voiceovers for short-form videos and ads.[39][40]
n8n AI video workflows (templates)	AI video generation + autopost	Ready-made n8n templates that convert text prompts (often from Telegram) into Kling/Flux-based short videos and publish to many socials.[41][42][^43]

Flowise, LangChain, and Dify serve as the main AI composition layer, while Stable Diffusion and ElevenLabs cover visuals and voice for ads and short-form content.[25][26][32][36][^39]

Example: End-to-End Autoposting Pipeline (n8n + LLM + Ayrshare/Postiz)

A typical production flow for full social content automation looks like:

1. **Trigger and Topic Intake**
   A webhook, cron, or internal event in n8n receives a topic, URL, or brief (e.g., from Telegram, Notion, or a CRM).[44][1]
2. **Content Planning & Drafting (LLM)**
   n8n uses an LLM node (OpenAI-compatible, or LangChain within n8n) to produce platform-specific text: TikTok hooks, Instagram captions, X threads, LinkedIn posts, etc.[45][1][^44]
3. **Asset Generation**
   - Images: call Stable Diffusion Web UI HTTP API (often via local URL) to generate images.[37][36]
   - Video: use community nodes for Kling or Flux; n8n templates show exactly how to construct cinematic short videos from a script.[41][42][^43]
4. **Scheduling & Posting**

- **API-first:** use Ayrshare's `/post` and `/auto-schedule` endpoints with `scheduleDate` and per-platform content fields to schedule across all desired networks.[15][16] [46][17] [^18]
- **Self-hosted scheduler:** send fully composed posts from n8n into Postiz via its API or n8n community node, letting Postiz handle calendar scheduling, optimization, and team approvals.[1][11] [^10]

5. **Analytics & Iteration**
   Pull engagement metrics from Ayrshare or Postiz, push to analytics tools (Plausible/PostHog), and feed back into LLM prompts for improved copy and creative tests.[47][48] [^18]

n8n's visual builder and 400+ integrations make it the preferred orchestrator for multi-platform social pipelines with AI and external APIs.[49][50] [^1]

Marketing AI (Beyond Social)

Core Marketing Automation & AI Orchestration

Tool	Role	Highlights
n8n (`n8n-io/n8n`)	Master automation and AI workflow engine	Self-hostable or cloud; combines visual flows with custom JS/Python code, native AI nodes, and connectors for CRMs, email, Slack, social, DBs, etc.[1][49] [^51]
LangChain (`langchain-ai/langchain`)	LLM agent framework	Orchestrates marketing agents for copywriting, funnel building, personalization, and data enrichment.[31][32]
Dify (`langgenius/dify`)	Agentic workflows & RAG	Ideal for building marketing copilots (landing page copy, SEO content, FAQs) with observability and plugin marketplace.[33][34] [^35]
crewAI (`crewaiinc/crewai`)	Multi-agent orchestration	Lets you define specialized agents (e.g., SEO strategist, copywriter, analyst) that collaborate on campaigns.[52][53]

With n8n for cross-tool automation and LangChain/Dify/crewAI for agent logic, you can implement multi-step marketing systems (lead research → messaging → campaign launch → reporting) without bespoke glue code for each SaaS.

Discovery URLs for AI Marketing Repositories

GitHub topic tags and ranking dashboards are the most efficient way to discover fresh, highly-starred marketing AI projects:

- **AI Marketing topic:** `https://github.com/topics/ai-marketing` – collections of AI-driven lead-gen, outreach, and campaign tools.[54][55]
- **Marketing Automation topic:** `https://github.com/topics/marketing-automation` – includes AI marketing suites and automation frameworks.[^56]

- **Social Media Automation topic**: `https://github.com/topics/social-media-automation` – projects that do cross-platform scraping, posting, and optimization.[57][58]
- **OSSInsight Trending**: `https://ossinsight.io/trending` – trending GitHub repos overall, with filters for AI.[4][59]
- **GitHub Ranking AI**: `http://yuxiaopeng.com/Github-Ranking-AI/Top100/AI.html` – daily top 100 AI repos by stars, including openclaw, n8n, AutoGPT, Stable Diffusion WebUI, Dify, LangChain, and Open WebUI.[3][60]

These URLs give you continuously updated "most-starred" lists without manually tracking star counts in this report.

Email Automation with AI

Self-Hosted Email Platforms

Tool	Role	Notes
Mailtrain v2 (`Mailtrain-org/mailtrain`)	Newsletters, sequences, lists	Node.js + MySQL/MariaDB based system for lists, campaigns, and automations; supports Docker and self-host deployment.[61][62][63][64]
Mail for Good (`freeCodeCamp/mail-for-good`)	Bulk campaigns over SES	Designed to send millions of emails via AWS SES at very low cost; includes deploy guides for AWS EC2.[65][66][^67]

Mailtrain is better for an all-in-one newsletter and drip-campaign product, while Mail for Good is ideal for high-volume, low-cost campaigns when you already have SES expertise.[61][65]

AI Email Agents & Reply Bots

Tool	Capability	Highlights
GPT-4 Email Assistant (`limyewjin/email-assistant`)	Full GPT-4 powered email agent	Handles email replies, task execution, and Google Calendar actions; configurable allowed senders and rich command set.[^68]
Email2GPT (`5d7/Email2GPT`)	Automation script for reading and replying	Python bot that reads unread emails, uses an OpenAI model to generate responses, creates PDF attachments, and sends replies automatically.[^69]
GPTEmailReplyBot (`reubenfirmin/GPTEmailReplyBot`)	Auto-reply bot	Connects to IMAP/SMTP, generates replies via OpenAI, and maintains per-sender personalities.[^70]

A practical architecture is to keep Mailtrain/Mail for Good as your campaign sender, while GPT-based agents run on a separate inbox that handles inbound replies, routing, and personal responses.[61][68][^65]

Telegram Chatbots & AI Integration

Bot Frameworks

Tool	Role	Rationale
aiogram (`aiogram/aiogram`)	Async Python bot framework	Modern, fully asynchronous framework for Telegram Bot API built on `asyncio` and `aiohttp`; excellent for high-throughput bots.[71][72][^73]
python-telegram-bot (`python-telegram-bot/python-telegram-bot`)	Feature-rich async wrapper	Extensive helper classes, `telegram.ext` abstractions, and good docs; supports Python 3.10+ and async handlers.[74][75][^76]

Both frameworks integrate cleanly with HTTP-based LLM APIs (OpenAI, Anthropic, local OpenAI-compatible endpoints from Open WebUI or AnythingLLM), so you can add "ask my bot" experiences on Telegram with local or cloud models.[74][72][^77]

Ready-Made AI Telegram Bots

Tool	Capability	Notes
chatgpt-telegram-bot (`n3d1117/chatgpt-telegram-bot`)	ChatGPT/DALL·E/Whisper bot	Docker-ready bot that connects to OpenAI chat, image, and speech APIs with minimal configuration.[^78]
GPT-Telegram-Bot (`snakeying/GPT-Telegram-Bot`)	Multi-model assistant	Supports OpenAI-compatible, Gemini, Claude, and others; offers context memory, image generation and analysis, multilingual support, and streaming replies.[^79]

For custom AI behavior, fork one of these bots, then swap the OpenAI backend with an OpenAI-compatible local endpoint (AnythingLLM, Open WebUI) or Claude via API, while preserving the Telegram command and dispatch logic.[78][2][^80]

Scheduling & Integration Hub (Connecting Social, Email, Telegram, Web)

Orchestration & Scheduling Layer

Tool	Role	Strengths
n8n (`n8n-io/n8n`)	Primary orchestrator	Visual builder with cron triggers, webhooks, queues, error handling, and native AI nodes; self-host or use cloud.[1][49][^50]
Postiz (`gitroomhq/postiz-app`)	Social scheduling backend	Provides the social calendar, analytics, and multi-channel publishing surfaces; integrates with n8n via community node and API.[11][10][^8]
Ayrshare (`ayrshare/social-media-api`)	Social scheduling API	Used directly from n8n via HTTP nodes, providing auto-scheduling and analytics for 13+ social networks.[15][16][46][17][^18]

n8n also has community nodes for Postiz and Late, plus HTTP and generic OAuth nodes, which makes it the natural "hub" to connect your AI agents to social networks, email, CRMs, Telegram, and analytics platforms.[81][1] [51][11]

Example Orchestration Pattern

1. **Input & Planning** – A daily cron node in n8n triggers a Flowise or LangChain-based planner agent which reads recent performance metrics and proposes content for each channel.[25][32] [^1]
2. **Asset Creation** – n8n runs Stable Diffusion, Kling, and ElevenLabs steps to generate creative assets.[41][36] [42][39]
3. **Queue & Approval** – Draft posts are pushed into Postiz or a Notion board; optional human approvals are requested via Slack/Telegram messages.[1][6] [^11]
4. **Publishing** – Approved items are sent to Postiz or Ayrshare with schedule times for TikTok, Instagram, YouTube, Facebook, X, LinkedIn, and Telegram.[8][11] [17][18]
5. **Analytics & Feedback** – Plausible and PostHog capture traffic and product usage, feeding back into planner prompts for A/B-style iteration.[47][82] [^48]

Local RAG, MCP, and IDE Integration (Claude Code / Aider / VS Code / Anything LLM)

Local LLM & RAG Servers

Tool	Role	Why It's Recommended
Ollama (`ollama/ollama`)	Local LLM runner	Runs models like Llama, Mistral, Gemma locally with a simple CLI and HTTP API; integrates with IDE tools and UIs.[83][84] [85][86]
AnythingLLM (`Mintplex-Labs/anything-llm`)	All-in-one RAG application	Full-stack app that lets you connect OpenAI, Anthropic, Ollama, LM Studio, and multiple vector DBs to build ChatGPT-like RAG workspaces over your docs.[2][87] [^88]
Open WebUI (`open-webui/open-webui`)	Self-hosted AI web UI	Extensible UI that connects to Ollama and any OpenAI-compatible endpoint; includes built-in RAG, plugins, and model management.[80][89] [90][77]
LlamaIndex (run-llama org)	RAG & data framework	Framework for building RAG and agentic systems; `create-llama` and example projects show how to build RAG servers with FastAPI/Next.js.[91][92] [93][94]
Vector DBs (`chroma-core/chroma`, `qdrant/qdrant`)	Embedding storage	Production-ready vector databases widely used with LangChain and LlamaIndex for RAG and semantic search.[95][96] [97][98]

Ollama provides local model execution, while AnythingLLM or Open WebUI handles the application layer (workspaces, chat UI, and RAG) and can be pointed at Ollama, cloud models, or both.[2][85] [87][80]

IDE & Code Assistant Integration

Tool	Role	Details
Aider (`Aider-AI/aider`)	Terminal-based pair programmer	Edits code in your git repo using GPT-4o, Claude 3.5, or any OpenAI-compatible endpoint; has GitHub Action and installer helpers.[99][100][101][102][^103]
Continue (`continuedev/continue`)	Source-controlled AI checks	Runs AI checks on pull requests as GitHub status checks; CLI + GitHub integration.[104][105][^106]
